2025.1 Partner Overview Q&A

Q1: Are Workbench Launcher Improvements based on a STEP component applicable only to this option or have any specific properties to be enabled?

A1: It's specific for the Workbench. We changed to do parallel download, retry when fail, and improved detection of changes.

Q2: Any plans to deprecate existing Web UI? Do we need to plan for migrating to Instrument UI down the line?

A2: We're taking a phased in approach for Instrument. This means that we are closely monitoring and collaborating with those customers who have implemented the new UI (Instrument UI) to ensure we support the need of their business and can plan out further enhancements as we go. We are also supporting a hybrid model, allowing customers to run both Web UI and the new UI in parallel. With this approach we encourage customers to start exploring the new UI however, we haven't put an end date on the WebUI as of now.

Q3: And when will we get the new Web UI? It is needed in a lot of businesses for Product Onboarding and the current one is a bit of a mess.

A3: It's already available. Please reach out to your Partner Manager for more information on how to get it enabled. Specifically for Product Onboarding there's also an opportunity to explore PDX with Søren Lundtoft.
